SEO Audit Report

everappz.com

April 15, 2026 | Software / App Publisher | Hugo (Hextra) on GitHub Pages

Table of Contents

1. Executive Summary	52/100
2. Technical SEO	65/100
3. Content Quality	55/100
4. On-Page SEO	35/100
5. Schema & Structured Data	5/100
6. Performance (Core Web Vitals)	80/100
7. AI Search Readiness (GEO)	30/100
8. Images	45/100
9. Backlink Profile (Qualitative)	
10. Prioritized Action Plan	

1. Executive Summary

65	55	35	5
TECHNICAL SEO	CONTENT	ON-PAGE	SCHEMA

80	30	45	52
PERFORMANCE	AI READINESS	IMAGES	OVERALL

Site Overview: everappz.com is a software publisher website built with Hugo (Hextra theme), hosted on GitHub Pages. The site showcases 4 iOS/Mac apps (Evermusic, Flacbox, Evertag, Evervideo) with 14M+ combined downloads. It features 47 how-to guides, 20 blog posts, 4 user guides, and comprehensive documentation.

Key Strengths: Solid static-site performance, extensive helpful content library (47 how-to articles), strong niche authority in iOS audio apps, established press coverage from 24+ publications.

Critical Gaps: Zero structured data (JSON-LD), no sitemap in robots.txt, unoptimized meta titles across all product pages, and llms.txt not enabled for AI search visibility.

Metric	Value
Total Pages in Sitemap	571 URLs
Product Pages	5 (Evermusic, Flacbox, Evertag, Evervideo, Soundy)
Blog Posts	20
How-To Guides	47
User Guides	4
Tag/Taxonomy Pages	~400
Known Referring Domains	24 (site-declared)
Issues Found	3 Critical, 6 High, 8 Medium, 4 Low

2. Technical SEO

65/100

Strengths

- HTTPS enabled site-wide
- Canonical tags auto-generated on all pages
- `meta robots: index, follow` in production builds
- Open Graph and Twitter Card meta tags present
- CSS minified, concatenated, and fingerprinted with SRI integrity
- Clean URL structure with trailing slashes
- FlexSearch enabled for on-site search

Issues

CRITICAL **No sitemap reference in robots.txt**

`robots.txt` contains only `User-agent: *` with no `Sitemap:` directive. Search engines may not discover the XML sitemap automatically.
Fix: Add `Sitemap: https://everappz.com/sitemap.xml` to robots.txt, or configure Hugo's `enableRobotsTXT` with a custom template that includes the sitemap URL.

HIGH **Sitemap: 571 URLs with identical lastmod dates**

All URLs have `2026-04-09T20:38:41+02:00`. Google devalues lastmod signals when dates are uniform. Hugo's `enableGitInfo: true` should provide per-page dates — the issue may be that all content was regenerated at once without individual git history.
Fix: Ensure each page's lastmod reflects its actual last modification date via Git commit history.

HIGH **~400 tag/taxonomy pages in sitemap**

Tag pages provide minimal unique content and consume crawl budget. The sitemap has ~400 tag URLs out of 571 total (70%).
Fix: Exclude tag pages from the sitemap, or add `noindex` to low-value taxonomy pages. Reduce sitemap to ~170 meaningful content URLs.

MEDIUM **Homepage title is just “Everappz”**

The `<title>` tag pattern for the homepage is simply the site title with no keywords or value proposition.
Fix: Update to something like “Everappz – iOS & Mac Apps for Music, Video & File Management”

MEDIUM `schema.html` **partial referenced but doesn’t exist**

> `head.html:28` calls `partial "schema.html"` but the file is missing from the theme. Hugo silently ignores this — no structured data is output.
> **Fix:** Create a `layouts/_partials/schema.html` file with JSON-LD structured data (see Section 5).

3. Content Quality

55/100

Strengths

- **47 how-to guides** covering specific user queries (NAS streaming, FLAC playback, CarPlay music, USB flash drives, etc.)
- **20 blog posts** with product announcements, comparisons, and technical articles
- **4 comprehensive user guides** per product app
- Blog displays author, date, reading time, tags, and categories
- Strong topical authority in iOS audio/video app niche
- Content covers long-tail queries that attract organic traffic

Issues

HIGH **Product page meta titles lack keywords**

Titles like “Evermusic – Everappz” miss target search terms entirely. Users searching for “offline music player iPhone” or “FLAC player iOS” won’t see relevant titles in SERPs.
Fix: Update to descriptive titles: “Evermusic: Free Offline Music Player for iPhone & Mac”, “Flacbox: Hi-Res Audio Player for iPhone & Mac (FLAC, DSD, APE)”

HIGH **Product page H1s are single words**

H1 tags show only the product name (“Evermusic”, “Flacbox”) with no descriptive keywords.
Fix: Add keyword-rich H1s that include product category and platform.

MEDIUM **No author profile pages**

Blog posts show author names but there are no linked author bio pages with credentials, social profiles, or expertise signals (E-E-A-T gap).
Fix: Create author profile pages with bios, credentials, and links to social profiles.

MEDIUM **Older blog content needs refresh**

Several blog posts date to 2014–2016 (“Evermusic 3 Million Downloads”, etc.) and reference outdated versions. Stale content can weigh down overall site quality signals.

4. On-Page SEO

35/100

On-page SEO is the weakest area. Key product pages — the most commercially valuable — lack fundamental optimization.

Page	Current Title	Recommended Title
/	Everappz	Everappz – iOS & Mac Apps for Music, Video & File Management
/products/evermusic/	Evermusic – Everappz	Evermusic: Free Offline Music Player for iPhone & Mac
/products/flacbox/	Flacbox – Everappz	Flacbox: Hi-Res Audio Player for iPhone & Mac (FLAC, DSD)
/products/evertag/	Evertag – Everappz	Evertag: Music Tag Editor for iPhone – Edit ID3, FLAC Tags
/products/evervideo/	Evervideo – Everappz	Evervideo: 360° Video Player for iPhone with Subtitles

HIGH **No internal linking strategy for high-value content**

47 how-to guides are valuable link-earning assets but are buried at depth 2–3. The homepage doesn't surface any of them.
Fix: Add a "Popular Guides" or "Getting Started" section on the homepage linking to top how-to articles.

MEDIUM **Missing breadcrumb navigation markup**

Breadcrumbs exist visually in the Hextra theme but lack BreadcrumbList schema markup for rich results.

5. Schema & Structured Data

5/100

Status: No JSON-LD structured data detected on any page. The theme references a `schema.html` partial that does not exist, resulting in zero structured data output.

Required Schema (by page type)

Schema Type	Applies To	Status	Priority
Organization	All pages (site-wide)	MISSING	Critical
WebSite + SearchAction	Homepage	MISSING	Critical
SoftwareApplication	Product pages (×5)	MISSING	Critical
Article / BlogPosting	Blog posts (×20)	MISSING	High
BreadcrumbList	All inner pages	MISSING	Medium

Recommended: Organization Schema

```
{
  "@context": "https://schema.org",
  "@type": "Organization",
  "name": "Everappz",
  "url": "https://everappz.com",
  "description": "iOS and Mac apps for audio, video, and file management",
  "sameAs": [
    "https://x.com/Everappz",
    "https://www.facebook.com/everappz",
    "https://www.reddit.com/r/everappz/",
    "https://github.com/everappz"
  ]
}
```

Recommended: SoftwareApplication Schema (Evermusic example)

```
{
  "@context": "https://schema.org",
  "@type": "SoftwareApplication",
  "name": "Evermusic",
  "operatingSystem": "iOS, macOS",
  "applicationCategory": "MultimediaApplication",
  "description": "Cloud music player with offline mode, equalizer, and playlist management",
  "downloadUrl": "https://apps.apple.com/app/evermusic/id885367198",
  "offers": {
```

```
    "@type": "Offer",
    "price": "0",
    "priceCurrency": "USD"
  }
}
```

6. Performance (Core Web Vitals) 80/100

Assessment: As a Hugo-generated static site, everappz.com benefits from excellent baseline performance. Pages are pre-rendered HTML with no server-side processing, resulting in fast TTFB. CSS is minified and fingerprinted.

Strengths

- Static HTML pages — no server-side rendering delay
- CSS concatenated, minified, and served with SRI integrity hashes
- Google Analytics uses `preconnect` for faster loading
- Critical JS (theme switching) is inlined to prevent flash of unstyled content
- No heavy JavaScript frameworks

Issues

MEDIUM **No explicit image lazy loading**

Product pages include multiple screenshots that may load eagerly, impacting LCP. Add `loading="lazy"` to below-fold images.

MEDIUM **No font preloading detected**

Web fonts may cause layout shift (CLS). Add `<link rel="preload">` for critical font files.

LOW **No real CWV field data available**

Configure a Google API key to access CrUX and PageSpeed Insights for real-user performance data.

7. AI Search Readiness (GEO)

30/100

Generative Engine Optimization (GEO) measures how well the site is positioned for AI-powered search (Google AI Overviews, ChatGPT, Perplexity, Bing Copilot).

HIGH **llms.txt returns 404**

The Hextra theme includes a `llms.txt` template at `themes/hextra/layouts/llms.txt`, but it is not enabled in `hugo.yaml`. The home page outputs are `["HTML", "RSS"]` and need `"llms"` added.
Fix: Change `hugo.yaml` line 12 from `home: ["HTML", "RSS"]` to `home: ["HTML", "RSS", "llms"]`

HIGH **No explicit AI crawler directives in robots.txt**

No rules for GPTBot, Google-Extended, CCBot, Anthropic-AI, or other AI crawlers. The current `User-agent: *` allows all by default, but explicit directives demonstrate intentional AI engagement.
Fix: Add explicit allow rules for key AI crawlers, or block specific ones if desired.

MEDIUM **Content lacks citation-ready formatting**

How-to guides would benefit from concise, quotable summary paragraphs at the top of each article. AI systems extract and cite well-structured passages more readily.

8. Images

45/100

MEDIUM **Alt text appears missing or generic on product screenshots**

Product pages include app screenshots but alt text attributes are not optimized for search or accessibility.

MEDIUM **No WebP/AVIF optimization detected**

Hugo supports image processing pipelines. Consider converting images to modern formats for better performance.

LOW **No default og:image configured**

`Site.Params.images` is not set. Social shares may lack preview images. Add a default OG image in hugo.yaml params.

9. Backlink Profile (Qualitative)

Note: No backlink API credentials are configured. Analysis is based on 24 press/referring domains declared in the site's press carousel. Independent verification was not possible.

Quality Tier	Domains	Ratio
High Authority (DA 70+)	imore.com, chip.de, bgr.com, mic.com, heise.de	~21%
Mid Authority (DA 40-69)	beebom.com, hongkiat.com, headphonesty.com, slashgear.com, lifehacker.ru, macupdate.com, mashtips.com, blisshq.com	~33%
Lower / Niche	11 remaining domains	~46%

Notable: OEM link from `support-en.wd.com` (Western Digital) is a high-trust editorial citation. Several high-authority links are 8–10 years old and may have decayed.

10. Prioritized Action Plan

CRITICAL Fix Immediately

#	Action	Impact
1	Add `Sitemap: https://everappz.com/sitemap.xml` to robots.txt	Sitemap discovery by all search engines
2	Create `schema.html` partial with Organization + WebSite + SoftwareApplication JSON-LD	Rich results eligibility, Knowledge Panel
3	Optimize product page meta titles with target keywords	SERP CTR improvement, keyword targeting

HIGH Fix Within 1 Week

#	Action	Impact
4	Optimize homepage title to include keywords	Brand + keyword SERP presence
5	Add keyword-rich H1 headings to product pages	On-page relevance signals
6	Enable llms.txt: add `"llms"` to home outputs in hugo.yaml	AI search visibility
7	Add Article/BlogPosting schema to blog posts	Rich results for blog content
8	Fix sitemap lastmod dates (per-page Git history)	Freshness signals to Google
9	Exclude low-value tag pages from sitemap (reduce 571→~170)	Crawl budget optimization

MEDIUM Fix Within 1 Month

#	Action	Impact
10	Add BreadcrumbList schema	Navigation rich results
11	Create author profile pages with E-E-A-T signals	Trust signals for blog content
12	Add “Popular Guides” section on homepage linking to top how-to articles	Internal link equity, user engagement
13	Add image lazy loading to templates	LCP and page load improvement
14	Configure default og:image in site params	Social sharing appearance
15	Optimize image alt text across product pages	Image search + accessibility

16	Add font preloading for web fonts	CLS reduction

LOW Backlog

#	Action	Impact
17	Refresh older blog content (pre-2020)	Content freshness signals
18	Configure Google PageSpeed API for CWV field data	Performance monitoring
19	Configure Moz API for backlink scoring	Link profile visibility
20	Target EN-language press (9to5Mac, MacRumors)	Backlink acquisition
21	Promote how-to content in Reddit/audio communities	Referral traffic + brand mentions
